

# *Laser Technicians*

ForTec Medical provides each client with help from a trained laser Safety Technician to assist with the entire procedure. Our technicians are given the best training to give everyone the best positive experience, including your patients.

Technicians arrive to set up the laser, adjust it, and complete laser safety checklists and test. They assist your team with power level adjustments according to the physician, answer any technical questions, and document all laser activities and settings to assure proper requirements are met.

*A technician is completing the laser safety checklist.*

Following the procedure, technicians present the completed laser safety checklist and procedural summary form to the Operating Room Supervisor or Circulating Nurse. Once all is finished, our technicians remove the laser from your facility, freeing your staff of any pickup or drop-off responsibilities of the equipment.

## **ForTec Medical's Laser Technician Credential Policies**

Our Technicians begin their training in the classroom. Laser safety and Physics is taught on each of the modalities. Our instructors make sure our technicians have a solid knowledge and familiarity with each laser's controls and standard power settings. They learn aseptic technique, as well as pre-operative and post-operative policies and procedures.

Our technicians continue their training in the field where they participate in actual cases with instructors. Oral, written and field tests are also given to ensure quality patient outcomes.

Our technicians are continually educated. As ForTec adds new products, technicians are trained on new lasers, technology and applications. Annual reviews are performed to maintain high standards of excellence.
